

PATIENT INFORMATION

MINIMALLY INVASIVE INTERVENTIONAL RADIOLOGY TREATMENTS

Interventional radiologists treat a large variety of medical conditions through minimally invasive image-guided procedures, reducing scarring and hospitalisation.

In many cases, these keyhole procedures can be carried out under local anaesthesia, eliminating the need for the patient to be put under.

Find out more about what interventional radiology (IR) can do for different conditions by scanning the QR code below and by asking your physician!
